Systemsthinking within Strategic Sustainability Constraints.

To be a strategic planner for sustainability, requires that the perspective is large enough in space (the biosphere) and time (as long as it takes). To be able to manage complexity for all essential aspects of sustainability, and to discover smart step-by-step investment routes, we need robust basic principles for sustainability, as well as for the strategic planning process to get there. This presentation will be about a generic framework for trans-disciplinary and cross-sector cooperation, based on a unifying theory for sustainability and sustainable development.
